

# Anti-Glycosaminoglycan Antibodies

The extracellular matrix (ECM) is an essential element for higher organisms to form cells, tissues, and organs; to control cell-cell connections and functions. The ECM also greatly affects several biological phenomena (such as development, aging, inflammation, wound healing, and immunity). Glycosaminoglycans (GAG), such as chondroitin sulfate, hyaluronic acid and keratan sulfate, are major components of the ECM and play an important role. Analysis of glycosaminoglycans is very difficult, especially when performing *in situ* analysis of cells and tissues. Thus, antibodies are particularly important as a detection tool.

## Anti-Keratan Sulfate Monoclonal Antibody (R-10G)

Isotype: Mouse IgG<sub>1</sub> 0.1mg/vial [A2968]

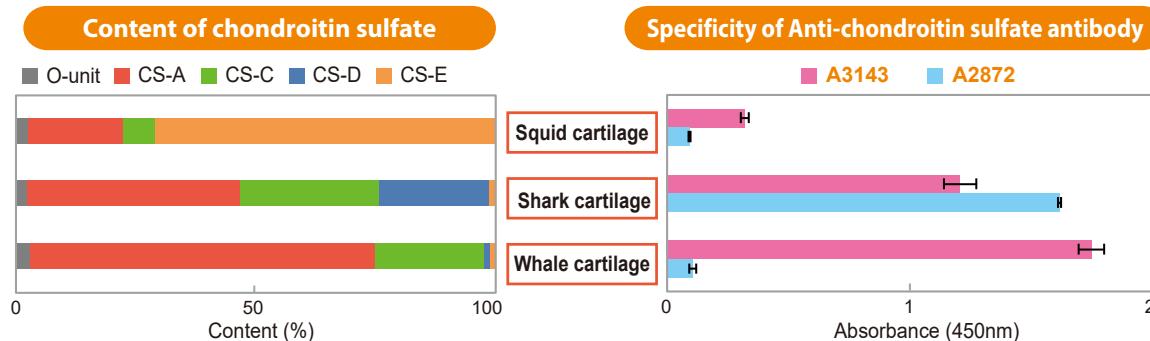

## Anti-Chondroitin Sulfate D Monoclonal Antibody (MO-225)

Isotype: Mouse IgM 0.1mg/vial [A2872]

## Anti-Chondroitin Sulfate A Monoclonal Antibody (LY111)

Isotype: Mouse IgM 0.1mg/vial [A3143]

**Anti-chondroitin sulfate antibody can be utilized for detection of the chondroitin sulfate A or D**

These chondroitin sulfate were coated on ELISA plate. These antigens and anti-chondroitin sulfate antibodies were reacted at appropriate time, then primary antibodies were detected using appropriate secondary antibodies.
